Clinical Letter

Prepared from the clinical visit note for care coordination and records.

Patient: LetterSmoke Gamma
Date of birth: 1968-11-03
Date of service: 2026-11-07
Physician: Elvis Francois, MD

REASON FOR EVALUATION

Follow-up lumbar stenosis

HISTORY OF PRESENT ILLNESS

62-year-old patient here for follow-up regarding known lumbar spinal stenosis. Reports no new or worsening symptoms since last visit. Continues with prescribed therapy/rehabilitation. No new radicular pain, motor weakness, bowel or bladder dysfunction. Gait concerns addressed; ambulates without assistive device at baseline.

RELEVANT HISTORY

Known lumbar spinal stenosis. Ongoing therapy/rehabilitation.

EXAMINATION

Gait: stable, non-antalgic, no gross imbalance. No focal neurologic deficits observed. No new sensory loss or motor weakness documented. Vital signs not recorded.

ASSESSMENT

1. Lumbar spinal stenosis — clinically stable since prior visit
2. Ambulation intact; no acute neurologic compromise

DISCUSSION AND PLAN

Continue current therapy/rehabilitation regimen. Reinforce home exercises and activity modifications as tolerated. Return precautions: new or worsening lower extremity weakness, increased radicular pain, or any bowel/bladder changes — seek prompt evaluation. Follow up as scheduled or sooner if symptoms progress.
